What will become our world in 25 years?

Our world will become very different in 25 years if we don't care about the environment. We need to start to recycle trash. When we throw trash under the water it doesn't disappear, it harms fish and other water animals, like turtles. We need to save them and start to take care about them! This situation is changeable, but not easily. It's very harmful to forests, which also suffer from deforestation. A while ago the Amazon Rainforest was burned down, which causes a lot of trouble for animals and humans. It created a lot of harmful Carbon Dioxide, which causes Global Warming

Pollution. We believe that if we work together, we could save the planet. Many firefighters lost their lives fighting against the burning rainforests, which could have been avoided. If we are more pleasant to our environment, we can save soil and drinking water from pollution. Also, the Global Climate Change is a big problem too. Our planet really needs our help! Maybe we will move into space and inhabit other planets for resources and shelter. If we could give you any advice, I would say: recycle and care about the environment! Your efforts will matter too!

Our planet really needs our help!
